

IMF Data Discovery & Extraction

Irina Klein

Master of Data Science Program
College of Computing

Illinois Institute of Technology

Joint work with Dr. Sou-Cheng T. Choi, Illinois Tech and SAS Institute Inc.

► PyData Global 2022

December 3, 2022

- 1 International Monetary Fund (IMF) data
- 2 JSON RESTful Web Service API
- 3 Proposed solution: **imfdatapy** package

Available Data

Dataset, a.k.a. Series	Dataset Name	Indicators
IFS	International Financial Statistics	Gross Domestic Product, Interest rates, Unemployment rates, Consumer Price Index, Industrial production, Exchange rates, Export and import, Government revenues and expenditures
GFS	Government Finance Statistics	Financial assets and liabilities classified by sector, Government revenue, Government cash flow
HPDD	Historical Public Debt Database	Debt to GDP ratio
PCPS	Primary Commodity Price System	Indices of market price for fuel and non-fuel commodities
DOTS	Direction of Trade Statistics	Value of Imports and Exports, Value of Trade Balance
FDID	Financial Development Index Database	Financial Development Index, Financial Market Index
CPI	Consumer Price Index	CPI for various goods and services groups

Table 1: Partial list of > 30 monthly, quarterly, or annual data series for 190 member countries from 1960's to present available from IMF [IMFa].

Data Extraction Methods

- **Web Query Interface** allows user interactions and customization of data tables and graphs online.
- **Bulk Download** allows downloading a zip file containing csv files for data and metadata for each dataset.
- **IMF Data Mapper** and **IMF Mobile App** provides data lists, summaries, and visualization for some of the IMF indices.
- **JSON RESTful Web Service API** can be accessed using Python or R to download JSON files automatically.

For detailed IMF help and documentation, see [IMFc].

Web Query Interface

International Financial Statistics (IFS)

Latest Update Date: 11/07/2022  

IFS Home Data Tables **Query** Archive About IFS

To display data please select the desired Time, Country and Indicator on the left. For detailed help documents please use ["How to Use Query"](#) in the [IMF knowledge repository](#).

Bulk Download

The screenshot shows the 'Download IMF Data' section of the IMF Data API website. At the top, there is a navigation bar with links for 'Home', 'Datasets', 'Data Topics', and 'Download IMF Data'. To the right of the navigation bar is a search bar with the text 'Search for IMF data:' and a 'GO' button. Below the navigation bar, there is a section titled 'To set up machine-to-machine data retrieval by dataset or across datasets, use Application Programming Interface' with a blue 'API' button. Below this, there is a section titled 'To retrieve data by dataset, click on Bulk Download icon next to the desired dataset below'. A list of datasets is displayed, each with a 'Bulk Download' icon (a download arrow) to its right. The datasets listed are: Asia and Pacific Regional Economic Outlook (APDREO), Balance of Payments (BOP), Balance of Payments (BOP), World and Regional Aggregates, Commodity Terms of Trade, Consumer Price Index (CPI), Coordinated Direct Investment Survey (CDIS), Coordinated Portfolio Investment Survey (CPIS), Currency Composition of Official Foreign Exchange Reserves (COFER), Direction of Trade Statistics (DOTS), and Export Diversification.

Home Datasets Data Topics **Download IMF Data**

Search for IMF data: **GO**

[Why sign in or register?](#)

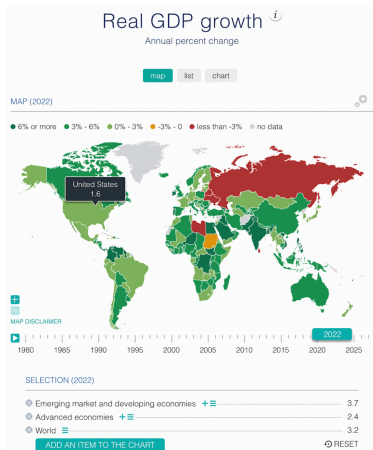

To set up machine-to-machine data retrieval by dataset or across datasets, use Application Programming Interface **API**

To retrieve data by dataset, click on Bulk Download icon next to the desired dataset below

- Asia and Pacific Regional Economic Outlook (APDREO) 
- Balance of Payments (BOP) 
- Balance of Payments (BOP), World and Regional Aggregates 
- Commodity Terms of Trade 
- Consumer Price Index (CPI) 
- Coordinated Direct Investment Survey (CDIS) 
- Coordinated Portfolio Investment Survey (CPIS) 
- Currency Composition of Official Foreign Exchange Reserves (COFER) 
- Direction of Trade Statistics (DOTS) 
- Export Diversification 

Interface to bulk download an IMF dataset [IMFd].

IMF Data Mapper and IMF Mobile App

Real GDP trend accessed through a web browser or the IMF mobile app on a phone or a tablet [IMFb, IMF15]. On the left: Map view; on the right: Chart view.

JSON RESTful Web Service API

JSON

A file format for data storage and transmission that consists of key-value pairs and arrays.

Example 1. A JSON string: first value in the area 'dimension' from the IFS data series.

```
{ '@value': 'AF', 'Description': { '@xml:lang': 'en', '#text': 'Afghanistan' } }
```

RESTful API

An interface to interact with resources on a server using the **RE**presentational **State T**ransfer design pattern. The main building blocks are the request from the user and the response from the server [Tec].

Example 2. Examples of using the IMF RESTful JSON API: [Dew16, Dew]. Additional examples are available in the **imfdatapy** Github repository (in the folder 'demo').

IMF-Specific Definitions

- **Series** is a dataset containing economic indices.
- **Indicator** is a set of time-indexed numeric values that represents an economic index or metric.
- **Dimension** is metadata for all indicators in an IMF data series. For example, in IMF series, most commonly the dimension are as follows:
 - Area¹ (e.g., the US)
 - Frequency (e.g., Quarterly)
 - Period (e.g., from 2020 to 2022)

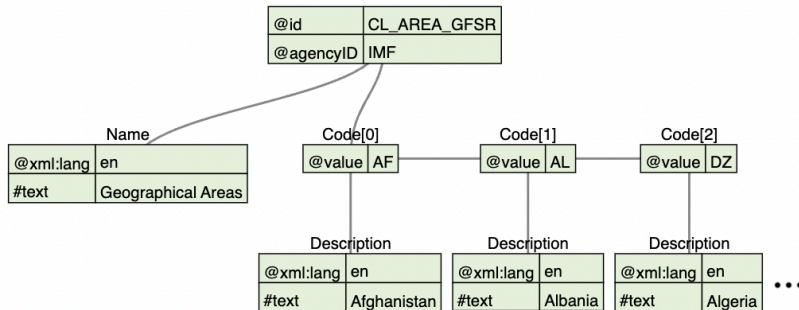

¹Area (or in some datasets 'Country') does not in all cases refer to a territorial entity of a state understood by international law. It may refer to a territorial group, such as the Eurozone or non-sovereign territories for which statistics are maintained.

Other Useful Definitions

- **Metadata** is a set of data that describes and gives information about other data.
- **Python package** is a collection of installable, reusable Python code modules that performs specified tasks.
- **Dataframe** is a two-dimensional tabular data format with columns of various data types.
- **Pandas Dataframe** is a dataframe from the Python package, Pandas.

- 1 International Monetary Fund (IMF) data
- 2 JSON RESTful Web Service API
- 3 Proposed solution: **imfdatapy** package

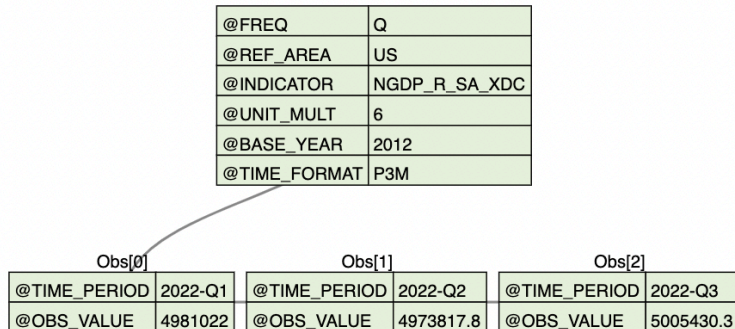

Metadata Structure

GFSR Area Dimension: first three items.

Note: This diagram is produced with JSON Tree Visualizer [Iva].

Data Structure

Quarterly Real Gross Domestic Product observations for the US in 2022.

Note: This diagram is produced with JSON Tree Visualizer [Iva].

Real GDP QoQ Change Example

Real Gross Domestic Product (Real GDP) is the inflation-adjusted monetary value of goods and services in a country in a given period of time.

Quarter-on-quarter (QoQ) is a change in performance between one quarter and the previous quarter.

To access the data using the JSON RESTful API, we need to:

- understand / lookup the dimensions of the series (index codes, country codes), using the `DataStructure` method², and specify the necessary dimensions
- request the data using the `CompactData` method

Python Notebook Example

²Description of the available methods can be found in [GitHub repository](#) and on [IMF website](#) [IMFe] 

Problem

- Structure of the JSON datasets varies from series to series. It is too complex for an unprepared or non-technical user and requires time to understand the dimensions and the data available to be able to successfully load the data.

Existing work

Table 2: Existing packages to explore and extract the IMF data.

Name	Language	Functionality	Available datasets	Limitations
<u>IMFData</u> [Lee16]	R	Search through series and index codes and output data, given series name, index codes and other parameters	All	Not actively maintained. Removed from CRAN. An archive version can be installed.
<u>datapungi_imf</u> [Ott20]	Python	Load data & metadata given series name, index code and other parameters	All	Some series (other than IFS) resulted in errors. Little documentation was provided. No information on unit tests. Source code was not available.
<u>imfpy</u> [Kea21]	Python	Search through the datasets, download data into pandas dataframe, visualize data	DOTS	Only one IMF dataset.
<u>PyIMF</u> [Egg22]	Python	Search through datasets and indices and output data, given index codes and other parameters	All	Installation using pip results in error. No source repository found. Documentation was not provided. No unit tests.
<u>imfdatapy</u> (working) [CK22]	Python	Search through series names. Download data & metadata given series name and index search terms into Pandas dataframes and csv files	BOP, FSI, IFS, DOT, GFSR,	Current limitations are described as part of the future work at the end of the slides

- 1 International Monetary Fund (IMF) data
- 2 JSON RESTful Web Service API
- 3 Proposed solution: **imfdatapy** package

Python **imfdatapy** package

We propose creating an API wrapper package in Python to

- mask or wrap the complexities of the IMF JSON RESTful API so that the users would not need to handle JSON data or its underlying metadata
- provide an intuitive way to search through the series or indicator names
- create detailed, searchable documentation
- ensure functionality with unit tests.

The current work is released as a Python package [BT22] and can be found at the GitHub repository: [imfdatapy GitHub page](#).

imfdatapy package architecture

The package is designed in an object-oriented way, with children objects inheriting functionality from the parent object. Each of the IMF's datasets is a child of the parent class, **IMF** object, which in turn is a child of the abstract class, **Series**.

Current classes in imfdatapy

Real GDP QoQ Change Example Using imfdatapy

To install the package run the command:

pip install imfdatapy

Now, the same example using the **imfdatapy** package.

Python Notebook Example.

Conclusions and Future Work

We have designed an extensible software architecture with simple APIs in the Python package, **imfdatapy**, for discovering and extracting IMF data series, pending the following tasks:

- Create comprehensive, searchable documentation
- Implement more robust input parsing
- Add all the IMF series with one or more unit tests for each series
- Perform large-scale testing
- Provide summary / descriptive statistics of the data and improve metadata visualization
- Collect and create more economic and financial use cases using **imfdatapy**
